# Center Concepts on Distance *k*-Dominating Sets

Dr. A. Anto Kinsley Department of Mathematics St.Xavier's (Autonomous) College Palayamkottai-627002, India V. Annie Vetha Joeshi Department of Mathematics St.Xavier's (Autonomous) College Palayamkottai-627002, India

**Abstract**: A set  $D \subseteq V(G)$  is called a *dominating set* of **G** if every vertex in V(G) - D is adjacent to some vertex in **D**. A set  $D \subseteq V$  is called a distance *k*-dominating set of *G* if each  $x \in V - D$  is within distance *k* from some vertex of *D*. In this paper, we determine the distance-*k* domination number for a given graph using the *k*-center and link vector concepts. Using the *k*-center concept we present some necessary and sufficient condition for distance-*k* dominating set.

Keywords: Distance, radius, domination number, distance k-domination number, k-center, reachable set, link vector.

# **1. INTRODUCTION**

Let G = (V, E) be a simple graph. The distance between u and v, denoted by d(u, v), is the length of a shortest u - v path. For a vertex  $v \in V$  and a positive integer k, the k-neighborhood of v in G is defined as  $N_k(v) = \{u \in V(G)/d(u, v) = k\}$ . For k = 1,  $N_1(v)$  is the neighborhood of v and simply denoted by N(v). Let d(x) = |N(x)| be the degree of G and  $\delta$  and  $\Delta$  be the minimum and maximum degree of G, respectively. The set  $N_k[v] = N_k(v) \cup \{v\}$  is called the closed k neighborhood v in G.

For a connected graph *G*, the eccentricity  $e(v) = \max\{d(u, v): \forall u \in V(G)\}$  and the eccentric set  $E(v) = \{u \in V: d(u, v) = e(v)\}$ . The minimum eccentricity among the vertices of *G* is its radius and the maximum eccentricity is its *diameter*, which is denoted by rad(G) and diam(G), respectively. A vertex *v* in *G* is a central vertex if e(v) = rad(G) and the subgraph induced by the central vertices of *G* is the *center Cen*(*G*) of *G*. In this paper, we present the relation between distance-*k* dominating set and *k*-center of the given graph. We study the binary operations  $\lor$ ,  $\land$  in [1]. Using these operations we construct algorithm to find the distance *k*-dominating set.

**Definition 1.1:** A set  $D \subseteq V(G)$  is called a *dominating set* of *G* if every vertex in V - D is adjacent to some vertex in *D*.

The *domination number*  $\gamma(G)$  is the minimum cardinality of a dominating set. We call the set of vertices as a  $\gamma$ -set if it is a dominating set with cardinality  $\gamma(G)$ .

**Definition 1.2:** A set  $D \subseteq V(G)$  is called a *distance k-dominating set* of G if  $N_k[D] = V$ . The *distance k-domination number*  $\gamma_k(G)$  of G.

# 2. k-center [1]

**Definition 2.1:** Let *S* be a subset of *V* with *k* vertices. Let  $v \in V$ . Then the distance of *S* from *v* is defined as  $d(S, v) = min\{d(x, v) | x \in S\}$ . If  $v \in S$  then d(S, v) = 0. The eccentricity of *S* is the maximum of d(S, v) over all  $v \in V$ . That is,  $e(S) = max\{d(S, v) | v \in V\}$ .Consider the family  $F_k$  of the subset *S* of *k* vertices  $(1 \le k \le n-1)$  of *G*. The *k*-center of the graph *G* is the set  $S^*$  of *k* vertices of *G* such that,  $e(S^*) = Min\{e(S), S \in F_k\}$ . This minimum eccentricity is called the radius of *k*-center and it is denoted by  $r_k(G)$ .

#### Theorem 2.2

Every central vertex with radius k forms a distance k-dominating set.

#### Proof

Let G be a graph with radius k. Let C(G) be the center of the graph G. Let  $C(G) = \{v_1, v_2, ..., v_m\}$ . If  $v_i \in C(G)$ ,  $(1 \le i \le m)$ , then  $e(v_i) = k$ . Hence  $d(v_i, v) = k$  for some v in V. Therefore  $d(v_i, v) \le k$  for all  $v \in V$  i.e, Each  $v_i$  is with distance k to all other vertices in G. Hence each  $v_i$  can dominate all the vertices of G with distance k. Hence every center vertex with radius k forms a distance k-dominating set.

### Theorem 2.3

For any connected graph with radius k,  $\gamma_k(G) = 1$ .

## Proof

Let *G* be any connected graph. Let *k* be the radius of *G*. Let *C*(*G*) be the center of *G*. Then e(v) = k for all  $v \in C(G)$ . Let  $v \in C(G)$  then  $max\{d(v, u) = k; u \in V\}$ . Also we have  $d(v, u) \le k; u \in V$ . Hence *v* dominates every vertex within distance k. So  $\gamma_k(G) = 1$ .

## Theorem 2.4

For any connected graph G,  $\gamma_k(G) = 1$  if and only if there exists a vertex in G with eccentricity  $\leq k$ .

#### Proof

Let G be any connected graph and  $V(G) = \{v_1, v_2, \dots, v_n\}$ . Suppose that  $\gamma_k(G) = 1$ . Let D be a minimum distance k-dominating set. Let  $x_i \in D$ .

**Case (i):** If  $r(G) \le k \le diam(G)$ , then there exists a vertex can dominate all the vertices within distance k. So that  $d(v_i, v) \le k \forall v \in V - \{v_i\}$ . Which implies that  $e(v_i) = max\{d(v_i, v), v \in V - \{v_i\}\} = k$ .

**Case(ii):** If k > diam(G), then there exists a vertex  $v_i$  can dominate all other vertices of *G* with distance less than *k*. Hence  $d(v_i, v) < k \forall v \in V - \{v_i\}$ . Which implies that  $e(v_i) = max\{d(v_i, v), v \in V - \{v_i\}\} < k$ .

 $\Box$ 

Conversely, assume that there exists a vertex with eccentricity  $\leq k$ . Let  $v_i$  be a vertex with  $e(v_i) \leq k$ . Then obviously,  $d(v_i, v) \leq k \quad \forall v \in V \cdot \{v_i\}$ . Hence  $D = \{v_i\}$  can dominate all other vertices of *G*. Then *D* is a minimum distance *k*-dominating set of *G*. Hence  $\gamma_k(G) = 1$ .

## Theorem 2.5

Every k-center of G with radius i is a distance i-dominating set.

#### Proof

Let *G* be any connected graph with *n* vertices. Let  $S_k$  be the *k*-center of *G* with radius *i*. Hence  $|S_k| = k$  and  $e(S_k) = i$ . That is the distance of  $S_k$  from the farthest vertex is *i*. Therefore,  $S_k$  dominates the farthest vertex with distance *i*. Hence  $S_k$  dominates all vertices of V within distance *i* and so  $S_k$  is a distance *i*-dominating set.

**Definition 2.6:** The set of all vertices of the graph *G*, from which the vertex *x* is connected within a minimum distance  $\lambda$  is called as a reachable set of *x* within a distance  $\lambda$  and is denoted as  $R_{\lambda}(x) = \{ y \in V/d(y, x) \le \lambda \}$ . Call this distance  $\lambda$  as penetration.

**Definition 2.7:** Characterize each vertex as a *n*-tuple. Each place of *n*-tuple can be represented by a binary zero or one. Call this *n*-tuple as a link vector simply LV of a vertex.

Thus a link vector  $(j_1, j_2, ..., j_n)$  represent a vertex  $x_j$  where  $j_k = 1$  if  $x_k$  is reachable within the penetration  $\lambda$  from  $x_j$  and zero otherwise. Denote a link vector of the vertex x by x' and denote the set of all link vectors as  $\Omega$ .

If all the coordinate of a link vector of a vertex are equal to one then the link vector is said to be full and is denoted as (1). If all the coordinates of a link vector of a vertex are equal to zero then the link vector is said to be null and it is denoted by (0).

**Definition 2.8:** Let G be a graph. Let  $\Omega$  be the set of LVs of all vertices. Define two binary operations V(cup) and A(cap) as follows:

$$V, \Lambda : \Omega \times \Omega \rightarrow \Omega by$$

$$(a_1, a_2, \dots, a_n) \vee (b_1, b_2, \dots, b_n) = (c_1, c_2, \dots, c_n)$$

where  $c_i = max\{a_i, b_i\}$  & *i*= 1 to *n* 

$$(a_{1,}a_{2},\ldots,a_{n})\wedge(b_{1,}b_{2},\ldots,b_{n})=(c_{1,}c_{2},\ldots,c_{n})$$

where 
$$c_i = min\{a_i, b_i\}$$
 &  $i = 1$  to  $n$ 

## Theorem 2.9

Let *G* be a graph with *n* vertices and  $r_k(G) = i$ . Let  $D \subseteq V$  of *k* vertices  $(1 \le k \le n-1)$ . Then *D* is a distance *i*-dominating set if and only if *D* is a *k*-center.

### Proof

Let  $D \subseteq V$  be a set of k vertices with  $r_k(G) = i$ . Suppose that D is a distance *i*-dominating set. Then there exists a vertex v in D such that  $d(u, v) \leq i$ , for every  $u \in V - D$ .  $\therefore e(D) =$ 

i = r(D). It implies that *D* is a *k*-center. Conversely, suppose that *D* is a *k*-center with radius *i*. By theorem 2.5, *D* is a distance *i*- dominating set.

Now we take i = 1, then we have the following corollary.

## Corollary 2.10 [1]

In any graph G with radius 1, a set D of k vertices  $1 \le k \le n-1$  is a dominating set if and only if D is a k-center.

#### Theorem 2.11

Let G be a graph with n vertices. Then  $\bigvee_{j=1}^{k} x_j'$  is full for a least integer k in G for  $\lambda = i$  if and only if  $D = \{x_1, x_2, ..., x_k\}$  is a minimum distance *i*-dominating set.

#### Proof

Consider the amount of penetration  $\lambda = i$ . Suppose that  $\bigvee_{j=1}^{k} x_{j'}$  is full where  $x_{j'}$  is the LV of  $x_{j}$ . Take  $x_{j'} = (x_{j_1}, x_{j_2}, \dots, x_{j_n})$  for a least integer k. Now  $\bigvee_{j=1}^{k} x_{j'} = (x_{1_1}, x_{1_2}, \dots, x_{1_n}) \lor (x_{2_1}, x_{2_2}, \dots, x_{2_n}) \lor \dots \lor (x_{k_1}, x_{k_2}, \dots, x_{k_n})$ . Since  $\bigvee_{j=1}^{k} x_j'$  is full, then  $(x_{1_1}, x_{1_2}, \dots, x_{1_n}) \lor (x_{2_1}, x_{2_2}, \dots, x_{2_n}) \lor \dots \lor \lor (x_{k_1}, x_{k_2}, \dots, x_{k_n})$ . Hence  $D = \{x_1, x_2, \dots, x_{k_n}\}$ 

 $(x_{k_1}, x_{k_2}, ..., x_{k_n}) = (1, 1, ..., 1)$ . Hence  $D = \{x_1, x_2, ..., x_k\}$  dominates V and it is a minimum distance *i*-dominating set. Since k is minimum.

Conversely, suppose that  $D = \{x_1, x_2, ..., x_k\}$  is a minimum distance *i*-dominating set. Then a vertex not in *D* is adjacent to at least one vertex of *D* within distance  $\lambda = i$ . That is,  $d(D, y) \le i \forall y \in V$ -*D*. Thus all coordinates of any one of  $x_1', x_2', ..., x_k'$  is 1. Hence  $x_1' \lor x_2' \lor ... \lor x_k'$  is full, that is  $\bigvee_{j=1}^k x_j'$  is full. It completes the proof.

### Theorem 2.12

Let *G* be a graph with *n* vertices. Then there exists a vertex whose link vector is full with  $\lambda = k$  if and only if  $\gamma_k(G) = 1$ .

#### Proof

Let *G* be a graph with *n* vertices. Suppose that there exists a vertex  $v_i$  whose link vector is full with penetration *k*. That is, the *j*<sup>th</sup> coordinate of  $v_i$ ' is 1 for every j  $(1 \le j \le n)$ . Hence the vertex  $v_i$  is reachable to all other vertices of *G* with penetration *k*. Hence this vertex  $v_i$  alone forms a distance *k* dominating set. Hence *D* is a minimum distance *k* -dominating set and so  $\gamma_k(G) = 1$ . Conversely, assume that  $\gamma_k(G) = 1$ . Let *D* be a  $\gamma_k$ -set of *G*. Take  $D = \{v_i\}$ . Then the vertex  $v_i$  is reachable to all other vertices within distance *k*. Hence  $v_i$  is reachable to all other vertices of *G* with  $\lambda = k$ . Then the LV  $v_i'$  of  $v_i$  is full.

## Theorem 2.13

If  $r(G) \le k \le diam(G)$ , then there exist a LV  $x_i'$  which is full with  $\lambda = k$ .

## Proof

Let *G* be a graph with *n* vertices. Assume that  $r(G) \le k \le diam(G)$ . Then there exists a vertex  $x_i$  of *G* with eccentricity *k*. By theorem 2.4,  $\gamma_k(G) = 1$ . Then by theorem 2.12,  $x_i'$  is full with  $\lambda = k$ .

# Theorem 2.14

Let G be a connected graph with n vertices. Then  $\Lambda_{i=1}^n x_i'$  is full with  $\lambda = 1$  if and only if G is complete.

# Proof

Let *G* be a connected graph with *n* vertices. Suppose that  $\bigwedge_{i=1}^{n} x_i'$  is full with  $\lambda = 1$ .

Then  $\bigwedge_{i=1}^{n} x_{i}' = min[(x_{1_{1}}, x_{1_{2}}, \dots, x_{1_{n}}) \land (x_{2_{1}}, x_{2_{2}}, \dots, x_{2_{n}}) \land \dots \land (x_{n_{1}}, x_{n_{2}}, \dots, x_{n_{n}}) = (1, 1, \dots, 1).$ Since the *j*<sup>th</sup> coordinate of  $x_{i}$  is full for all *i*, *j*  $(1 \le i, j \le n)$ , then the vertex  $x_{i}$  is reachable to all other vertices. Hence *G* is complete.

Conversely, Take  $\Lambda_{i=1}^n x_i' = min[(x_{1_1}, x_{1_2}, ..., x_{1_n}) \land (x_{2_1}, x_{2_2}, ..., x_{2_n}) \land ... \land (x_{n_1}, x_{n_2}, ..., x_{n_n})]$ . Since *G* is complete, link vector of every vertex is full. Hence  $\Lambda_{i=1}^n x_i'$  is full. Thus the link vector concept is very useful to prove many results.

## Algorithm 2.15

Algorithm to find a minimum distance *i*-dominating set

Input. A graph G = (V, E) with  $V(G) = \{x_1, x_2, \dots, x_n\}$  with

distance matrix and diam(G) = d. Find all reachable

sets  $R_{\lambda}(x_j)$  of  $x_j$  and find the link vector  $x_j'$  of  $x_j$ 

Output. Minimum distance *i*-dominating set. Step 1. i = 1 to d

## Step 2.

- 2.1. Take *w*' is the LV of *w*. Initialize *w*' $\leftarrow$ (0) and *D* = Ø
- 2.2. For j = 1 to n  $w' = w' \lor x_j'$  $D = D \lor \{x_i\}$
- 2.3. If w' is not full then go to step 3.2
- 2.4. Print D is a minimum distance i -dominating set.

Otherwise go to step 3.2

2.5 Go to step 1.

This algorithm finds *d* number of minimum distance *i*-dominating sets, for i = 1 to *d*. It works with a for loop j = 1 to *n*, for a fixed *i*. To find a minimum distance *i*-dominating set this algorithm works with the operations  $\vee$  and  $\cup$  in 2n times. Totally it works in 2*nd* times and so it is a polynomial time algorithm.
